

FIELD CROP DATA 1966 - 1970

FLORIDA CROP AND LIVESTOCK REPORTING SERVICE

**Joe E. Mullin, Agricultural Statistician in Charge
1222 Woodward Street
Orlando, Florida 32803**

ACKNOWLEDGEMENTS

The publication of this bulletin is made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service wants to express its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under U. S. D. A. programs. Others contributing information were the Florida Department of Agriculture, Agricultural Experiment Stations and Cooperative Extension Service.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official statistics prepared by the Florida Crop and Livestock Reporting Service.

Acreage, Yield, Production and Value:	
Field Crops, 1966-1970	2-3
Acreage, Yield and Production, By County:	
Corn, 1967-1970.	4-5
Peanuts, 1967-1969	6
Soybeans, 1967-1969	6
Tobacco, Type 14, 1967-1969.	7
Wheat, 1967-1969	7

INTRODUCTION AND COMMENTS

This publication is a follow-up to that issued in 1968 which contained historical data on field crops from 1919 through 1966 and the preliminary estimates for 1967. The purpose of it is to bring all interested people and the general public up to date on the recent developments concerning the production of major crops in Florida. A particular effort has been made to meet the diverse needs and interests of different users for a reliable reference on State and County acreage, production and value of such major crops. Persons needing current data are served by reports issued monthly or twice-a-year, based on the latest data this office has available. The estimates on such reports are subject to revisions as more current or more complete data becomes available. Annual supplements to this bulletin will be issued to keep the series current and to provide a medium for publishing revisions.

Crop estimates are designed to help farmers, agricultural agents, research workers, and others in agriculture in keeping abreast of current changes and in appraising future prospects in the light of past experience. It represents a part of the Department's continuing program to provide comprehensive data as a background for making analyses of the different segments of agriculture.

Agriculture is Florida's most important industry. Changes occurring in recent years have made production and marketing information an absolute necessity for the successful conduct of agricultural business. It is hoped the information contained in this book will be of use to you in running your operation or business.

During the last five years one of the most dramatic changes in Florida's agriculture has been the tremendous increase experienced in soybean acreage, up from 82,000 acres in 1966 to 188,000 acres in 1970. Productionwise, the 2,160,000 bushels in 1966 compare with 5,152,000 bushels in 1970. This production, combined with the highest season average price ever enjoyed by Florida producers, has jacked soybeans up as third highest income producing field crop, following sugarcane and flue-cured tobacco.

Sugarcane continues ranking first as the highest source of income for the State among all field crops. The 1970 season saw an increase in acreage compared to the preceding season but still the 179,000 harvested acres is the second lowest in the last five years. On the other hand, the 33.5 tons per acre is the second highest yield in that same period; besides, the \$10.82 per ton is the highest season average price on record. Total value of production at \$64,888,000 is also highest on

record. Blackstrap molasses and bagasse continue being the two most important by-products of the industry; the first used primarily in feeding cattle and the second to generate power for the sugar mills with the surplus going for bedding and litter for poultry and other animal industries.

Flue-cured tobacco or Type 14 tobacco still is second among field crops as far as total value of production is concerned. The 1970 season had the highest yield, production and value on record. Only in two previous seasons had yields been above 1,900 pounds per acre, and for the first time in Florida average yield was above one ton per acre. High yielding varieties along with better and more intensive cultural practices have been primarily responsible for the increases lately enjoyed by Florida producers. Naturally, higher land values and cost of labor have induced the more progressive producers to go this route. Much of this tobacco is disposed of through export channels.

Shade-grown or Type 62 tobacco (cigar wrapper) is primarily grown around Quincy; this being so because of soil requirements. There is also a small acreage grown in Madison County and in South Georgia. Most of this tobacco is utilized within the continental United States.

Cotton harvested acreage has changed relatively little in the last three years after reaching an all-time low of 10,700 harvested acres in 1967. The 1970 season average price per pound of 23 cents has been the second best in the last five years. In recent years, acreage for harvest has increased in Santa Rosa County, where yields are highest, and declined in other counties where yields are usually lower.

Field corn in Florida has been declining since 1967 when a record yield of 50 bushels per acre was established. The 1970 yield of 25 bushels per acre is the lowest for the State since 1958. Acreagewise, the 322,000 acres harvested in 1970 is lowest since 1962 when 319,000 acres were harvested. Corn growers went through one of the worst seasons in history during 1970 due to the southern corn leaf blight disaster which caused production to be reduced to 58 percent of what it was in 1969 and 36 percent of the record 22,450,000 bushels in 1967.

Peanut acreage has remained relatively stable in the last decade or so. On the other hand and as a result of better varieties and more intensive type of cultivation, both yields and production have been increasing almost steadily. The average yield of over a ton per acre in 1970 is a record high for the State, same as production at 105,060,000 bushels.
